

SHAKING TABLE

3000

The Wilfley 3000 Shaking Table replaces the Half Size Table and includes a host of important new features which make the machine even more user friendly.

Key Features

- The machine combines the best of both Holman and Wilfley tables.
- Unit is driven by the Holman head motion, with a stroke adjustment of between 10mm and 16mm (nominal).
- The self lubricating head motion is of simple robust design, and requires minimal maintenance.
- The deck is supported on 20 carriers like the Holman table, and has the advantage of being vibrated along its entire length like the Wilfley table.
- Decks are made from high quality marine plywood with standard smooth rubber covers for durability. Other covers are available on request.
- Decks are profiled to reduce short circuiting of materials to the concentrate edge, promoting flow of products into discharge launders and minimising spillage.
- Different riffle patterns can be supplied to maximise metallurgical performance.
- Table tilt can be easily adjusted using a hand wheel whilst the machine is in operation.
- Choice of concrete plinth or steel base mountings.
- Unit now comes fitted with direct on line starter.

Typical Applications

- Technical research and development in schools, colleges and universities.
- Recovery of precious metals from low tonnage streams.
- Recovery of copper wire from cable.
- Recovery of precious metals from electronic circuit boards.
- Recovery of synthetic diamonds.
- Quality control testing in silica sand industry.
